

## Secure exam flow on student laptops

0 – Intune pushes the app, script and configuration to student laptops.

1 – Teacher creates the exam and uploads the content.

2 – The system creates one folder per student on a SharePoint site, with no student access yet.

3 – At exam time, the teacher « starts » the exam in the app.

4 – The system grants students access to their folder.

5 – Students launch the app on their laptop from their normal session.

6 – The app signs the student in and retrieves their exam(s). If one is available:

7 – It runs a script that reboots the machine into the local guest exam account in multi-app kiosk mode, blocking all apps except the ones allowed for that student and that exam, and opens Edge on the student's SharePoint folder.

8 – In the exam portal, the teacher can see that all students are in « exam » mode.

9 – The teacher flags the end of the exam, which removes student access to SharePoint (documents remain, visible to teachers only).

10 – The student reboots and returns to their normal session.
